Arun Vasan

Objective

To identify a practical AI-based fitness companion that helps users create structured, goal-oriented workout plans and receive general wellness guidance.

Prepared for academic project submission

1. Brainstorming & Ideation Phase

Problem Statement

- Many people find it difficult to plan a consistent weekly exercise routine that matches their goals, experience and preferred intensity. Generic plans may not account for personal preferences or changing needs.

Ideas Considered

- Personalized 7-day workout plan generator
- AI-generated nutrition and recovery tip
- Feedback-based plan revision
- User profile and plan history
- Admin view for registered users
- REST API for integration and testing

Selected Concept

- FitBuddy AI Fitness Plan Generator: a web application that accepts a user's profile, fitness goal, intensity and experience level, then generates a structured seven-day plan and one concise general wellness tip. Users can submit feedback to revise the plan.

Target Users

- People seeking general fitness organization, including beginners and users with different experience levels. The application is an educational wellness tool, not a medical service.

Core Value

- Convenient plan generation, readable daily workout structure, feedback-based adaptation and persistent plan records.

Expected Outcome

- A working web application with a responsive form, AI integration, database storage, feedback flow, API endpoints and basic automated tests.

Team Discussion & Decision

- The team selected the plan-generator concept because it connects a clear user need with achievable web and AI features. The initial scope focuses on a safe, seven-day general fitness plan rather than diagnosis or medical treatment.
